

File Type & Relationship

File type	Example file(s)	What it contains	How we use it in the project	Relationship with other files
.CAD	3070500A.CAD, 3070501A.CAD, 30705A4A.CAD, 30705Z2A.CAD	Bailey INFI 90 engineering/logic sheets. Contains function-block logic, I/O references, interconnections, block identities, descriptions, source/destination references and engineering text.	Primary source for DCS logic reconstruction. Extract AI/AO/DI/DO, function blocks, block numbers, tags, descriptions, connections, logic structure and function-code specifications. Also used to generate the full CAD logic-sheet PDF/viewer representation .	Connected to .OUT for cross-sheet connections, .REF for tag/reference information, .LST for sheet inventory, .LOG/CADSYNC.LOG for processing history, and .CFG for configured block/module data.
.M1	322P01.m1, 322PT01.m1, 322PS02.m1, 322PL01.m1	Bailey graphics/model definitions. Contains graphical objects, models, tags, text, buttons, references, graphic indices and display components.	Primary source for operator graphics. Extract graphic objects, tags and descriptions, build graphics relationships, and generate M1 graphics PDFs/screenshots and the graphics viewer.	Related to CAD/I/O through shared engineering tags. M1 can represent the operator-facing visualization of signals/devices whose control logic exists in .CAD.
.OUT	I90XREF.OUT	Human-readable I90 cross-reference report . Has CAD sheet sections, Outputs, Inputs, descriptions, source points and destination points/sheets.	Primary cross-sheet mapping source. Use it to determine where a signal originates and where it goes. This is critical for building the connection graph between CAD sheets.	Generated from/derived from .CAD sheets. References other .CAD files. Should be linked back to I/O and function-block records extracted from CAD.
.REF	30705.REF	Reference/tag database content for the module. Contains a large set of signal/tag/reference names such as DI1-1A/322AUX-M107A, AI6-8/322LT-654, etc.	Use as a reference/tag index to normalize and validate signals discovered in CAD/XREF data. Helps build the master tag database.	Closely related to .CAD; many tags found in REF appear in CAD/XREF. Can be used to validate or enrich parsed CAD I/O.
.XRF	I90XREF.XRF	Cross-reference processing log . Records that XREF processing handled 243 CAD sheets, identifies sheets being read, and records issues such as blank descriptions.	Use for ingestion diagnostics and validation , not as the main engineering data source. It can tell the application whether all CAD sheets were processed and whether warnings occurred.	Relates directly to .CAD, .OUT, and .ERR. It is evidence of the XREF generation/process performed over the CAD set.
.ERR	I90XREF.ERR	Unresolved cross-reference records. Contains unresolved outputs and their source CAD locations.	Very useful for a validation/error panel in the viewer. Do not silently discard these records. Flag them as unresolved links.	Generated during XREF processing against .CAD; corresponds to gaps/errors in .OUT.
.CFG	30705.CFG, CONFIG.CFG	Binary configuration data for the DCS module. Contains module/function-block configuration	Use for configuration-level function block data , block/spec validation and potentially S1/S2/...	Directly related to .VFY; 30705.VFY compares these configurations. Also related to CAD because CAD

		information and specifications. 30705.CFG is the module/source configuration; CONFIG.CFG is a reference configuration in the supplied verification workflow.	specification extraction where the data is encoded in configuration.	logic/function blocks ultimately correspond to configured control blocks.
.VFY	30705.VFY	Configuration verification report. Explicitly identifies Loop 3 / PCU 7 / Module 5 and compares source/reference CFG data.	Use for verification and consistency checking . Can show whether source and reference configurations agree and expose differing function-code specifications.	Compares .CFG files. Helps validate the engineering model derived from CAD/configuration data.
.MHD	30705.MHD	Module-header information. Contains module identity/type information such as MFP02.	Use to establish module metadata : module number, module type and other header-level information.	Relates to .CFG, .LST, .LOG, .VFY and the hierarchy L3 → P7 → M5 → Module 30705.
.LST	30705.LST, MSTR.LST, SELCT.LST	Project/module selection and sheet lists. 30705.LST contains CAD sheet names; MSTR.LST identifies module 30705; SELCT.LST points to the project path.	Use as the project index/manifest . It tells the ingestion engine what CAD sheets belong to the module and what module/project is selected.	Drives ingestion of .CAD; identifies the module represented by .MHD, .CFG, .LOG, etc.
.LOG	30705.LOG, CADSYNC.LOG, UNTITLED.LOG	Processing history/logs. 30705.LOG lists CAD-sheet processing; CADSYNC.LOG records CAD synchronization and module/sheet processing; UNTITLED.LOG contains script/verification activity and configuration differences.	Use for audit trail, processing status, debugging and validation . Can expose warnings, errors, sheet counts and verification differences.	Describes operations involving .CAD, .LST, .CFG, .VFY, and XREF processing.
.MDC	30705SA.MDC	Path/reference information. In this archive it contains a path pointing back to the Bailey project/module environment.	Mostly environment/project metadata . Useful for retaining source provenance and original project location, not for core I/O extraction.	Points back to the project structure containing .CAD and related engineering files.
.GES	STRINGS.GES	Legacy/global string/resource data. The supplied file contains a long binary/resource-style record rather than a useful standalone engineering table.	Keep as supporting resource data . Initially archive it and associate it with the project; only parse further if the rendering/graphics engine requires its strings/resources.	Potentially supports legacy graphics/configuration resources used by other files, especially the graphics environment.
.BND	30705.BND	Module-associated data containing engineering text/tags, e.g. WOODYARD POWER CONSUMPTION, 411FI-0205, etc.	Use as supporting engineering metadata . Potentially useful to enrich descriptions/tags that are not fully represented elsewhere.	Related to the module and engineering tag ecosystem; should be correlated with CAD/REF/M1 tags where matches exist.

.BAT	M5.bat, P7.bat	Legacy batch/automation command files associated with the old Bailey project environment.	Mostly process/provenance information . They may reveal how the original engineering environment invoked utilities, but they are not primary engineering data.	Associated with the folder hierarchy/project processing environment and other legacy tools/logs.
